

Build Steps

1 Create Your Agent in Copilot Studio

Open Copilot Studio, select Create, then New agent. Configure:

Agent Name	IT Helpdesk Assistant
Description	Helps employees troubleshoot common IT issues, reset passwords, and raise support tickets.
Tone	Friendly, professional, step-by-step

2 Add Agent Instructions

Paste the following into the Instructions box:

```
You are an IT Helpdesk Assistant for internal employees.  
Your role is to help with common IT issues quickly and clearly.  
  
When answering questions:  
- Guide users step-by-step through self-service fixes  
- Ask clarifying questions to identify the right system  
- If the issue cannot be resolved, offer to raise a ticket  
- Always be professional, patient, and concise  
  
You can help with: password resets, VPN issues, email  
setup, MFA configuration, and general IT troubleshooting.  
For hardware issues, raise a support ticket immediately.
```

3 Add a Topic

Go to Topics > New topic > From blank. Build a password reset flow:

- **Trigger phrases** "reset my password", "forgot password", "can't log in"
- **Question node** Ask: "Which system do you need a password reset for?"
Options: Email / VPN / SharePoint / Other
- **Message node** Show the relevant self-service reset link for the selected system
- **Condition node** If user selects "Other", escalate to a support ticket

This single topic gives you trigger phrases, questions, branching logic, and message nodes.

4 Add a Tool

Go to Tools and create a tool that logs a support ticket:

- Create a new tool using a Power Automate flow
- Inputs: Employee name, Issue description, System affected
- The flow sends a formatted message to a Teams channel or shared mailbox
- Returns a confirmation message with a ticket reference number

Connect this tool to the "Other" branch of your topic so unresolved issues become tickets.

5 Add Suggested Prompts

Add these as Conversation starters so users know what the agent can do:

I need to reset my password

My VPN won't connect

I want to raise a support ticket

How do I set up multi-factor authentication?

6 Test & Evaluate

Use the Test pane to validate your agent end-to-end:

- Click Test your agent in the top right to open the test chat
- Try each conversation starter and check the branching logic works
- Trigger the escalation path and confirm the tool fires correctly
- Check the Conversation map to see how topics connect visually

Try These Live

Use these queries during the build-along to test your agent.

Password Reset Flow

Reset my password
I forgot my SharePoint password

Troubleshooting

My VPN won't connect
Outlook keeps crashing
How do I set up MFA?

Ticket Escalation

I need to raise a support ticket
My laptop screen is broken

7 Review Analytics

Open the Analytics tab to understand how your agent is performing:

- Session outcomes — how many conversations were resolved vs escalated
- Topic performance — which topics are triggered most and where users drop off
- Customer satisfaction — CSAT scores if feedback is enabled
- Conversation transcripts — review real interactions to improve the agent

Analytics are available after publishing. In today's session, we'll walk through the dashboard layout.

How to Think About This Agent

This agent replaces:

- Employees searching knowledge bases manually
- Repetitive password reset calls to IT
- Untracked support requests via email or chat

With:

- ✓ Guided self-service for common issues
- ✓ Automatic ticket creation for complex ones
- ✓ Full analytics on what employees need help with

This is a governed, internal agent — connected to your systems, not the open internet.

Tip for real-world use

In production, connect to your ITSM platform (ServiceNow, Jira Service Management) and restrict access via Azure AD security groups. Today's session focuses on capability and pattern.

You've built an agent ✓

You now have an AI agent that can:

- Guide employees through IT self-service
- Raise support tickets automatically
- Track resolution rates via analytics
- Scale across Teams, web, and more
