Microsoft Scout

Microsoft Scout is a desktop AI application that takes action across your files, shell, browser, development tools and Microsoft 365 data. This one pager walks you from install to your first task. Admin access setup is on page 2.

BEFORE YOU BEGIN

- **Supported platform:** Windows 11, or macOS 12 (Monterey) or later
 - **Active Microsoft 365 Copilot licence** assigned to your account
 - **Local administrator rights**, including an Intune-enabled account
 - **Microsoft 365 work or school account** (personal accounts are not supported)
 - **Microsoft Visual C++ redistributable** (Windows only)
 - **GitHub Copilot Business or Enterprise licence**
- You also need Frontier preview enrolment, and your IT admin must complete both access gates before you can sign in. [See admin access on page 2.](#)

SETUP, STEP BY STEP

1 Install Microsoft Scout

Download the installer for Windows or macOS from [aka.ms/msscout](#), run it, and follow the prompts. Scout then appears in your applications menu.

3 Configure your workspace

Set a workspace directory, or accept the default. This is where Scout reads and writes files, so choose a folder you use for active projects. Change it later in **Settings**.

5 Connect to Microsoft 365

In **Settings**, complete the Microsoft 365 sign-in to reach email, calendar, Teams and OneDrive. Anything that sends, shares, replies, forwards or updates content others can see needs your confirmation first.

2 Sign in

Select **Sign in to Microsoft 365** with your organisational credentials and grant permissions. Then select **Sign in to GitHub** with a Copilot Business or Enterprise account.

4 Choose a personality OPTIONAL

Personality presets change Scout's conversational style. The default is helpful and professional. Switch any time using the application icon next to the prompt field.

6 Run your first task

Type what you want done in the chat input and press **Enter**. Be specific, for example "draft a reply to Sarah's budget email confirming I will attend Thursday". Scout shows its progress as it works.

DEFAULT SETTINGS

- WorkIQ connectivity** search across Microsoft 365 On
- Shell access** request terminal commands On
- Auto-approve** enable per capability Off

HOW PERMISSIONS WORK

- Auto-approve**
Runs automatically only where you have explicitly allowed it.
- Prompt**
Scout pauses and shows the action. You approve or deny.
- Deny**
The action is blocked. Dangerous commands use this by default.

EXPLORE SETTINGS

- Appearance Default model Workspace directory
- Permissions Memory Privacy Cloud sync
- Power management Window behaviour

REVIEW RESULTS

Scout renders results in the conversation using rich markdown, including tables, code blocks, Mermaid diagrams and inline images. Files it creates, including **Word**, **Excel** and **PowerPoint** documents, are saved to your workspace directory and open in their native apps.

ADMIN ACCESS

The two-gate access model

Microsoft Scout is available only in Microsoft Frontier, and access needs **two separate gates that both must be complete**. A GitHub Copilot licence alone does not grant Frontier access, and Frontier access alone does not work without a Copilot licence. Installing the app grants nothing on its own. Sign-in only succeeds once both gates are done.

BOTH GATES MUST OPEN BEFORE A USER CAN SIGN IN

Neither gate works alone. **Both Frontier access and admin enablement must be complete**, and each user needs a GitHub Copilot Business or Enterprise licence, before any sign-in will succeed.

ACCESS FLOW AT A GLANCE

Install always succeeds. Sign-in is where access is enforced.

If Frontier is not on, or the Intune policy or attestation is missing, sign-in fails and the app shows **no clear reason** in-product. If users report sign-in problems, verify both admin gates before troubleshooting the client.
